AMINO SUBSTITUTED DIBENZOTHIOPHENE DERIVATIVES FOR THE TREATMENT OF DISORDERS
MEDIATED BY THE NP Y5 RECEPTOR

This invention relates to compounds which antagonise the interaction between
neuropeptide Y (NPY) and the neuropeptide Y5 (NPY-5) receptor sub-type. This invention
5 also relates to processes for the manufacture of NPY-5 receptor antagonists or agonists,
pharmaceutically acceptable salts thereof, and to novel pharmaceutical compositions of
NPY-5 receptor antagonists or agonists.

NPY is a 36 amino acid polypeptide which is a member of the pancreatic polypeptide
family of regulatory peptides with widespread distribution throughout the mammalian system.
10 NPY is the most abundant neuropeptide in the central and peripheral nervous systems and has
been shown to have powerful and complex effects on feeding, anxiety, circadian rhythms,
reproduction, pituitary-adrenocortical axis function, memory retention, seizures,
thermo-regulation, and cardiovascular and gastrointestinal functions. NPY interacts with a
heterogeneous population of at least six receptor subtypes, Y₁-Y₆ which activate adenylate
15 cyclase via a G-protein. For reviews of NPY see: CRC Critical Reviews in Neurobiology.
(1988) 4, 97-135; Regulatory Peptides (1996) 62, 1-11.

One of the most striking actions of NPY is induction of feeding in a variety of
vertebrate species. Direct injection of NPY into the hypothalamus of sated rats can increase
food intake up to 10-fold over a 4 hour period and NPY is the only known peptide which can
20 cause animals to eat until they are obese. Recent studies on NPY have focussed on the
identification of the NPY receptor responsible for the regulation of feeding. The NPY-5
receptor has been identified as the receptor most closely matching a proposed appetite
receptor. The functional role of this receptor was addressed by receptor blockade studies.
Intra-cerebro-ventricular injection of NPY-5 receptor antisense oligodeoxynucleotides
25 prevented the increase in hypothalamic NPY levels during food deprivation and inhibited
fasting-induced food intake in rats [Schaffhauser et al (1997) Diabetes 46, 1792 - 1798]. Thus
the NPY-5 receptor is a potential pharmacological target in the modulation of feeding
disorders such as obesity. For reviews on the association between NPY and feeding see:
Zimanyi et al (1998) Current Pharm Des 4, 349-66; Heinrichs et al (1998) Vitamins and
30 Hormones 54, 51-66.

Obesity is a large and ever expanding problem in affluent societies, which has reached
epidemic proportions. According to the US Institute of Medicine, 59% of Americans are

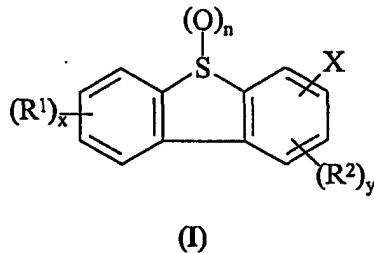

- 2 -

clinically obese or at least 20% above their ideal body weight. Obesity is associated with susceptibility to a number of other conditions e.g. non-insulin-dependent diabetes, hypertension, dyslipidaemia and coronary heart disease. These conditions lead to reduction in life expectancy and decreased quality of life. The overall financial burden of obesity is

5 difficult to quantify but it has been estimated that in the US it may account for 6-8% of total healthcare expenditure.

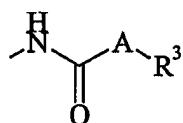

Thus there is need for pharmaceutical agents which have efficacy in the treatment of eating disorders such as obesity, anorexia and bulimia. Modulation of NPY activity through antagonism at the NPY-5 receptor offers one potential target for pharmacological intervention
10 in these conditions.

Accordingly, the present invention provides a compound of formula (I):

Compounds of formula (VIII) are commercially available or they are known compounds or they are prepared by processes known in the art.

15 It will be appreciated that certain of the various ring substituents in the compounds of the present invention may be introduced by standard aromatic substitution reactions or generated by conventional functional group modifications either prior to or immediately following the processes mentioned above, and as such are included in the process aspect of the invention. Such reactions and modifications include, for example, introduction of a 20 substituent by means of an aromatic substitution reaction, reduction of substituents, alkylation of substituents and oxidation of substituents. The reagents and reaction conditions for such procedures are well known in the chemical art. Particular examples of aromatic substitution reactions include the introduction of a nitro group using concentrated nitric acid, the introduction of an acyl group using, for example, an acyl halide and Lewis acid (such as 25 aluminium trichloride) under Friedel Crafts conditions; the introduction of an alkyl group using an alkyl halide and Lewis acid (such as aluminium trichloride) under Friedel Crafts conditions; and the introduction of a halo group. Particular examples of modifications include the reduction of a nitro group to an amino group by for example, catalytic hydrogenation with a nickel catalyst or treatment with iron in the presence of hydrochloric acid with heating; 30 oxidation of alkylthio to alkylsulphinyl or alkylsulphonyl. The reader is referred to Advanced Organic Chemistry, 4th Edition, by Jerry March, published by John Wiley & Sons 1992, for general guidance on reaction conditions and reagents.

It will also be appreciated that in some of the reactions mentioned herein it may be necessary/desirable to protect any sensitive groups in the compounds. The instances where protection is necessary or desirable and suitable methods for protection are known to those skilled in the art. Conventional protecting groups may be used in accordance with standard practice (for illustration see T.W. Green, Protective Groups in Organic Synthesis, John Wiley and Sons, 1991). Thus, if reactants include groups such as amino, carboxy or hydroxy it may be desirable to protect the group in some of the reactions mentioned herein.

A suitable protecting group for an amino or alkylamino group is, for example, an acyl group, for example an alkanoyl group such as acetyl, an alkoxycarbonyl group, for example a 10 methoxycarbonyl, ethoxycarbonyl or *t*-butoxycarbonyl group, an arylmethoxycarbonyl group, for example benzyloxycarbonyl, or an aroyl group, for example benzoyl. The deprotection conditions for the above protecting groups necessarily vary with the choice of protecting group. Thus, for example, an acyl group such as an alkanoyl or alkoxycarbonyl group or an aroyl group may be removed for example, by hydrolysis with a suitable base such as an alkali 15 metal hydroxide, for example lithium or sodium hydroxide. Alternatively an acyl group such as a *t*-butoxycarbonyl group may be removed, for example, by treatment with a suitable acid as hydrochloric, sulphuric or phosphoric acid or trifluoroacetic acid and an arylmethoxycarbonyl group such as a benzyloxycarbonyl group may be removed, for example, by hydrogenation over a catalyst such as palladium-on-carbon, or by treatment with 20 a Lewis acid for example boron tris(trifluoroacetate). A suitable alternative protecting group for a primary amino group is, for example, a phthaloyl group which may be removed by treatment with an alkylamine, for example dimethylaminopropylamine, or with hydrazine.

A suitable protecting group for a hydroxy group is, for example, an acyl group, for example an alkanoyl group such as acetyl, an aroyl group, for example benzoyl, or an 25 arylmethyl group, for example benzyl. The deprotection conditions for the above protecting groups will necessarily vary with the choice of protecting group. Thus, for example, an acyl group such as an alkanoyl or an aroyl group may be removed, for example, by hydrolysis with a suitable base such as an alkali metal hydroxide, for example lithium or sodium hydroxide. Alternatively an arylmethyl group such as a benzyl group may be removed, for example, by 30 hydrogenation over a catalyst such as palladium-on-carbon.

A suitable protecting group for a carboxy group is, for example, an esterifying group, for example a methyl or an ethyl group which may be removed, for example, by hydrolysis

with a base such as sodium hydroxide, or for example a *t*-butyl group which may be removed, for example, by treatment with an acid, for example an organic acid such as trifluoroacetic acid, or for example a benzyl group which may be removed, for example, by hydrogenation over a catalyst such as palladium-on-carbon.

5 The protecting groups may be removed at any convenient stage in the synthesis using conventional techniques well known in the chemical art.

Biological Assays

The activity of compounds of the invention was measured in a neuropeptide Y5 receptor binding assay as follows. Compounds were also tested in binding assays for the 10 neuropeptide Y₁ and neuropeptide Y₂ receptors. Activity against these 2 receptors is contraindicated for a neuropeptide Y5 antagonist.

a) Expression of human neuropeptide Y5 receptor in High 5TM insect cells.

High 5TM insect cells were obtained from Invitrogen (catalogue N° B855-02) and stored in liquid nitrogen. Cells were revived from liquid nitrogen storage and grown at 28°C 15 in 100 ml ExCell 405 (JRH Biosciences) serum free medium in a 250 ml conical flask (Corning) agitated at 140 rpm in an Innova 4330 orbital shaker (New Brunswick Scientific). Cultures were routinely sub-cultured every 3 - 4 days.

High 5TM insect cells were transfected with the human NPY5 receptor as follows. PCR primers were designed against the huNPY5 receptor sequence, Genbank Accession Number 20 U56079 [Gerald *et. al.* (1996) Nature 382, 168-171], but starting at base 56 through to base 1393, to express the protein 10 amino acid residues shorter at the amino terminal end [see Borowsky *et. al.* (1998) Regulatory Peptides 75-76, 45-53]. These primers were used to amplify the huNPY5 receptor from human placenta genomic DNA by PCR. This was then sub-cloned into pZERO2 (obtained from Invitrogen) for sequencing and re-cloned into 25 pFASTBAC1(obtained from GIBCO BRL Life Technologies) for expression. Human NPY_r was isolated from pZERO2 on BamHI fragment and sub-cloned into pFastbac1 on BamHI restriction site. The junctions were sequenced to ensure correct prior to expression.

A baculovirus containing the pFASTBAC1 was then generated using the Bac-to-BacTM baculovirus expression system [Anderson et al (1996) FASEB Journal 10(6), 727-726] 30 (obtained from GIBCO BRL Life Technologies) following the protocol supplied with this expression system by GIBCO BRL Life Technologies.

- 33 -

High 5TM insect cells were infected with the baculovirus to transfect the cells with the human neuropeptide Y5 receptor as follows: Batches were grown for membrane preparation by inoculating 5 L of ExCell 405TM medium in a 7 L Bioreactor (FT-Applikon) with 1.75 x 10⁹ mid log High 5TM cells. After 2-3 days growth at 28°C the mid log culture was infected

5 with Baculovirus expressing the human NPY5 receptor at a multiplicity of infection (MOI) of 1.0. Cells (typically 1x10¹⁰) were harvested 48 hours post infection by centrifugation (Heraeus Omniprime 2.0RS 30 min, 296 g, 4°C) and flash frozen in liquid nitrogen for storage at -80°C.

b) Membrane preparation procedure

The following buffer was prepared daily and stored at 4°C. 50 mM Tris HCl pH 7.4, 5 mM EDTA and 10% w.v. sucrose. A protease inhibitor cocktail (Boehringer Mannheim) was added to both buffers according to the manufacturers instruction. Cells were thawed rapidly in three times their packed cell volume of hypotonic buffer (3:1 mix of water and buffer) and lysed routinely on ice using five Vibra Cell Sonicator (Sonics and Materials Inc.) bursts of ten seconds for the High 5TM insect cells. The cell lysate (typically 10-15 ml) was carefully loaded onto a 10 ml 41% sucrose cushion which was topped off with lysis buffer and spun at 150,000 g for 1 hour at 4°C in a Beckman Optima LE-80K Ultracentrifuge. The membrane fraction was carefully removed from the inter-phase and diluted at least four fold with lysis buffer. The membrane pellets were recovered by centrifugation at 150,000 g for 20 min at 4°C in a Beckman Optima LE-80K Ultracentrifuge and re-suspended at 5x10⁷ cell equivalents per ml.

15 20 The re-suspended membranes were divided into working aliquots, routinely 1 ml, flash frozen in liquid nitrogen and stored frozen at -80°C until use.

Prior to use the 1 ml High 5TM membranes were thawed and resuspended in 8 ml binding buffer (see below). Membranes are used at approximately 7µg/ml of protein per incubate.

25 c) Neuropeptide Y5 receptor binding assay

The following reagents were used:

Binding buffer: 50 mM HEPES, 2.5 mM CaCl₂, 1 mM MgCl₂, 0.5% BSA, pH=7.4

Binding wash buffer: 50 mM HEPES, 2.5 mM CaCl₂, 1 mM MgCl₂, 0.5 M NaCl, 0.5% BSA, pH=7.4

30 Unifilter GFC filter plates: 50µl of 0.5% polyethyleneimine was added to each well and left to equilibrate for four hours before use

Incubation plates: 96 well polypropylene plates, siliconised prior to use

Test Compounds: Compounds were dissolved in DMSO at a concentration of 1 mM. Final concentration of DMSO in the assay did not exceed 1%.

Peptide PYY (pancreatic polypeptide Y) - 10 μ M stock solution in binding buffer.

125 I PYY - 10 μ Ci/ml stock solution, diluted 1:10 dilution, into binding buffer.

5 Assays were performed in 96 well microtitre plates. 10 μ l of diluted test compound was added to each well of a plate, followed by 80 μ l of membranes and 10 μ l of radiolabelled 125 I PYY (0.01 μ Ci per well). Total and non-specific binding controls were included in each plate. The non-specific binding wells received 10 μ l of Peptide PYY from the 10 μ M stock solution, whilst the total binding wells received 10 μ l of binding buffer. For each assay, a

10 duplicate dose response of peptide PYY was included, top concentration 1 μ M.

The plates were incubated for two hours at room temperature with mixing, and then filtered onto the pre-treated filter plates. The incubation plates were washed twice with 150 μ l of cold binding wash buffer per well, then the filter plates were further washed with approximately 2.5 ml per well. The filter plates were dried overnight at room temperature, the 15 bottoms were sealed, and 20 μ l of Scintillant (Microscint 40, Canberra Packard) was added to each well. The tops of the plates were sealed and the plates were counted for 1 minute on a protocol set up for 125 I on a 96 well plate liquid scintillation counter (Top Count, Canberra Packard).

Compounds were considered to be active if they inhibited the binding by more than 20 50% at a concentration of 10 μ M. Dose responses were carried out on all compounds found to be active (8 point curves in duplicate).

Although the pharmacological properties of the compounds of the formula (I) vary with structural change as expected, in general compounds of the formula (I) possess an IC₅₀ in the above test in the range, for example, 0.0002 to 200 μ M. For example, the compound of 25 Example 16 has an IC₅₀ for the neuropeptide Y5 receptor of 94nM.

In order to use a compound of the formula (I) or a pharmaceutically acceptable salt, prodrug or solvate thereof, for the therapeutic treatment (including prophylactic treatment) of mammals including humans, it is normally formulated in accordance with standard pharmaceutical practice as a pharmaceutical composition.

30 Therefore according to a further aspect of the invention there is provided a pharmaceutical composition which comprises a compound of the formula (I) or a

pharmaceutically acceptable salt, prodrug or solvate thereof, as defined herein before in association with a pharmaceutically acceptable diluent or carrier.

According to another aspect of the invention there is provided a pharmaceutical composition comprising a compound of formula (I), or a pharmaceutically acceptable salt, 5 prodrug or solvate thereof, in association with a pharmaceutically acceptable diluent or carrier for the treatment of disorders mediated by the neuropeptide Y5 receptor in a warm-blooded animal, such as a human being in need of such treatment.

To treat disorders mediated by the neuropeptide Y5 receptor neuropeptide Y5 receptor agonists or antagonists can be administered.

10 According to an additional aspect of the invention there is provided a pharmaceutical composition comprising a compound of formula (I), or a pharmaceutically acceptable salt, prodrug or solvate thereof, in association with a pharmaceutically acceptable diluent or carrier for the treatment of eating disorders in a warm-blooded animal, such as a human being.

15 According to an additional aspect of the invention there is provided a pharmaceutical composition comprising a compound of formula (I), or a pharmaceutically acceptable salt, prodrug or solvate thereof, in association with a pharmaceutically acceptable diluent or carrier for promoting weight loss in a warm-blooded animal, such as a human being.

20 Examples of disorders mediated by the neuropeptide Y5 receptor are eating disorders. Examples of eating disorders include obesity, bulimia or anorexia. Examples of eating disorders include obesity and related disorders, bulimia or anorexia. Examples of “related disorders” are diabetes dyslipidaemia, hypertension and sleep disturbances. Preferably “related disorders” refers to diabetes.

25 The compositions of the invention may be in a form suitable for oral use (for example as tablets, lozenges, hard or soft capsules, aqueous or oily suspensions, emulsions, dispersible powders or granules, syrups or elixirs), for topical use (for example as creams, ointments, gels, or aqueous or oily solutions or suspensions), for administration by inhalation (for example as a finely divided powder or a liquid aerosol), for administration by insufflation (for 30 example as a finely divided powder) or for parenteral administration (for example as a sterile aqueous or oily solution for intravenous, subcutaneous, intramuscular or intramuscular dosing or as a suppository for rectal dosing).

The compositions of the invention may be obtained by conventional procedures using conventional pharmaceutical excipients, well known in the art. Thus, compositions intended for oral use may contain, for example, one or more colouring, sweetening, flavouring and/or preservative agents.

5 Suitable pharmaceutically-acceptable excipients for a tablet formulation include, for example, inert diluents such as lactose, sodium carbonate, calcium phosphate or calcium carbonate, granulating and disintegrating agents such as corn starch or algenic acid; binding agents such as starch; lubricating agents such as magnesium stearate, stearic acid or talc; preservative agents such as ethyl or propyl *p*-hydroxybenzoate, and anti-oxidants, such as 10 ascorbic acid. Tablet formulations may be uncoated or coated either to modify their disintegration and the subsequent absorption of the active ingredient within the gastrointestinal tract, or to improve their stability and/or appearance, in either case, using conventional coating agents and procedures well known in the art.

Compositions for oral use may be in the form of hard gelatin capsules in which the 15 active ingredient is mixed with an inert solid diluent, for example, calcium carbonate, calcium phosphate or kaolin, or as soft gelatin capsules in which the active ingredient is mixed with water or an oil such as peanut oil, liquid paraffin, or olive oil.

Aqueous suspensions generally contain the active ingredient in finely powdered form together with one or more suspending agents, such as sodium carboxymethylcellulose, 20 methylcellulose, hydroxypropylmethylcellulose, sodium alginate, polyvinyl-pyrrolidone, gum tragacanth and gum acacia; dispersing or wetting agents such as lecithin or condensation products of an alkylene oxide with fatty acids (for example polyoxethylene stearate), or condensation products of ethylene oxide with long chain aliphatic alcohols, for example heptadecaethyleneoxycetanol, or condensation products of ethylene oxide with partial esters 25 derived from fatty acids and a hexitol such as polyoxyethylene sorbitol monooleate, or condensation products of ethylene oxide with partial esters derived from fatty acids and hexitol anhydrides, for example polyethylene sorbitan monooleate. The aqueous suspensions may also contain one or more preservatives (such as ethyl or propyl *p*-hydroxybenzoate, anti-oxidants (such as ascorbic acid), colouring agents, flavouring agents, and/or sweetening 30 agents (such as sucrose, saccharine or aspartame).

Oily suspensions may be formulated by suspending the active ingredient in a vegetable oil (such as arachis oil, olive oil, sesame oil or coconut oil) or in a mineral oil (such as liquid

paraffin). The oily suspensions may also contain a thickening agent such as beeswax, hard paraffin or cetyl alcohol. Sweetening agents such as those set out above, and flavouring agents may be added to provide a palatable oral preparation. These compositions may be preserved by the addition of an anti-oxidant such as ascorbic acid.

5 Dispersible powders and granules suitable for preparation of an aqueous suspension by the addition of water generally contain the active ingredient together with a dispersing or wetting agent, suspending agent and one or more preservatives. Suitable dispersing or wetting agents and suspending agents are exemplified by those already mentioned above. Additional excipients such as sweetening, flavouring and colouring agents, may also be present.

10 The pharmaceutical compositions of the invention may also be in the form of oil-in-water emulsions. The oily phase may be a vegetable oil, such as olive oil or arachis oil, or a mineral oil, such as for example liquid paraffin or a mixture of any of these. Suitable emulsifying agents may be, for example, naturally-occurring gums such as gum acacia or gum tragacanth, naturally-occurring phosphatides such as soya bean, lecithin, an esters or partial 15 esters derived from fatty acids and hexitol anhydrides (for example sorbitan monooleate) and condensation products of the said partial esters with ethylene oxide such as polyoxyethylene sorbitan monooleate. The emulsions may also contain sweetening, flavouring and preservative agents.

Syrups and elixirs may be formulated with sweetening agents such as glycerol, 20 propylene glycol, sorbitol, aspartame or sucrose, and may also contain a demulcent, preservative, flavouring and/or colouring agent.

The pharmaceutical compositions may also be in the form of a sterile injectable aqueous or oily suspension, which may be formulated according to known procedures using one or more of the appropriate dispersing or wetting agents and suspending agents, which 25 have been mentioned above. A sterile injectable preparation may also be a sterile injectable solution or suspension in a non-toxic parenterally-acceptable diluent or solvent, for example a solution in 1,3-butanediol.

Suppository formulations may be prepared by mixing the active ingredient with a suitable non-irritating excipient which is solid at ordinary temperatures but liquid at the rectal 30 temperature and will therefore melt in the rectum to release the drug. Suitable excipients include, for example, cocoa butter and polyethylene glycols.

Topical formulations, such as creams, ointments, gels and aqueous or oily solutions or

suspensions, may generally be obtained by formulating an active ingredient with a conventional, topically acceptable, vehicle or diluent using conventional procedures well known in the art.

Compositions for administration by insufflation may be in the form of a finely divided powder containing particles of average diameter of, for example, 30 μ m or much less, the powder itself comprising either active ingredient alone or diluted with one or more physiologically acceptable carriers such as lactose. The powder for insufflation is then conveniently retained in a capsule containing, for example, 1 to 50 mg of active ingredient for use with a turbo-inhaler device, such as is used for insufflation of the known agent sodium 10 cromoglycate.

Compositions for administration by inhalation may be in the form of a conventional pressurised aerosol arranged to dispense the active ingredient either as an aerosol containing finely divided solid or liquid droplets. Conventional aerosol propellants such as volatile fluorinated hydrocarbons or hydrocarbons may be used and the aerosol device is conveniently 15 arranged to dispense a metered quantity of active ingredient.

For further information on formulation the reader is referred to Chapter 25.2 in Volume 5 of Comprehensive Medicinal Chemistry (Corwin Hansch; Chairman of Editorial Board), Pergamon Press 1990.

The amount of active ingredient that is combined with one or more excipients to 20 produce a single dosage form will necessarily vary depending upon the host treated and the particular route of administration. For example, a formulation intended for oral administration to humans will generally contain, for example, from 0.5 mg to 2 g of active agent compounded with an appropriate and convenient amount of excipients which may vary from about 5 to about 98 percent by weight of the total composition. Dosage unit forms will 25 generally contain about 1 mg to about 500 mg of an active ingredient. For further information on Routes of Administration and Dosage Regimes the reader is referred to Chapter 25.3 in Volume 5 of Comprehensive Medicinal Chemistry (Corwin Hansch; Chairman of Editorial Board), Pergamon Press 1990.

The size of the dose for therapeutic or prophylactic purposes of a compound of the 30 formula (I) will naturally vary according to the nature and severity of the conditions, the age and sex of the animal or patient and the route of administration, according to well known principles of medicine.

In using a compound of the formula (I) for therapeutic or prophylactic purposes it will generally be administered so that a daily dose in the range, for example, 0.5 mg to 75 mg per kg body weight is received, given if required in divided doses. In general lower doses will be administered when a parenteral route is employed. Thus, for example, for intravenous

5 administration, a dose in the range, for example, 0.5 mg to 30 mg per kg body weight will generally be used. Similarly, for administration by inhalation, a dose in the range, for example, 0.5 mg to 25 mg per kg body weight will be used. Oral administration is however preferred, particularly in tablet form. Typically, unit dosage forms will contain about 1 mg to 500 mg of a compound of this invention.

10 The compounds of this invention may be used in combination with other drugs and therapies used in the treatment of disease states which would benefit from antagonism at the neuropeptide Y5 receptor. For example, the compounds of the formula (I) could be used in combination with drugs and therapies used in the treatment of eating disorders.

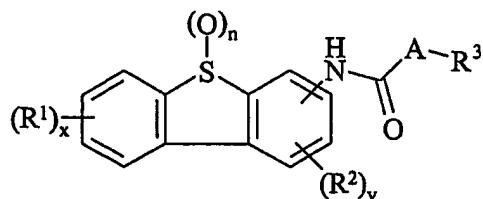

If formulated as a fixed dose such combination products employ the compounds of

15 this invention within the dosage range described herein and the other pharmaceutically-active agent within its approved dosage range. Sequential use is contemplated when a combination formulation is inappropriate.

Although the compounds of the formula (I) are primarily of value as therapeutic agents for use in a warm-blooded animal, such as a human being, they are also useful

20 whenever it is required to antagonise binding at the neuropeptide Y5 receptor. Thus, they are useful as pharmacological standards for use in the development of new biological tests and in the search for new pharmacological agents.
